

Kanopy-Creating a Custom Clip

This guide will show you how to make short clips from our streaming media resource Kanopy to enhance teaching and presentations.

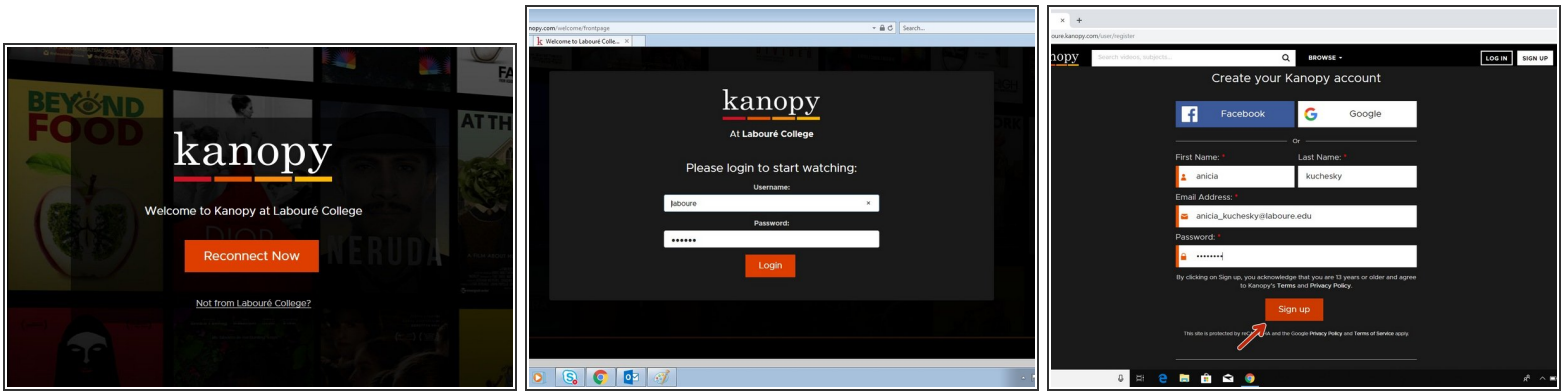

Written By: Anicia Kuchesky

INTRODUCTION

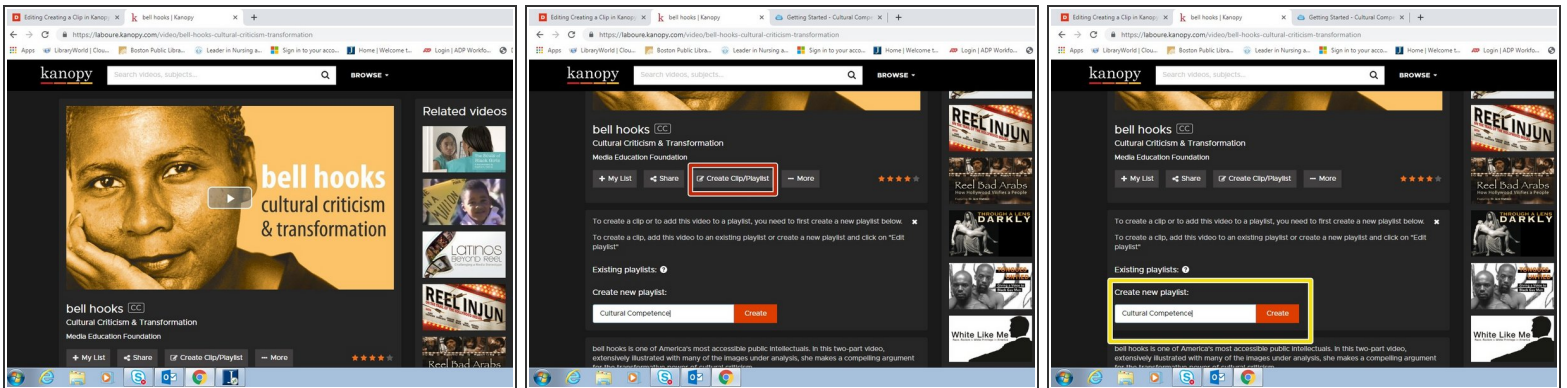

When a clip or playlist is created, it has a unique URL and can be made public or kept private. The URL can be shared with others via email or otherwise, and there is a unique embed code for it as well. All clips and playlists will be saved on the platform for you under your profile, so that it is not lost and you can always revisit it (unless you manually delete the clip/playlist).

Step 1 — Logging in and creating an account

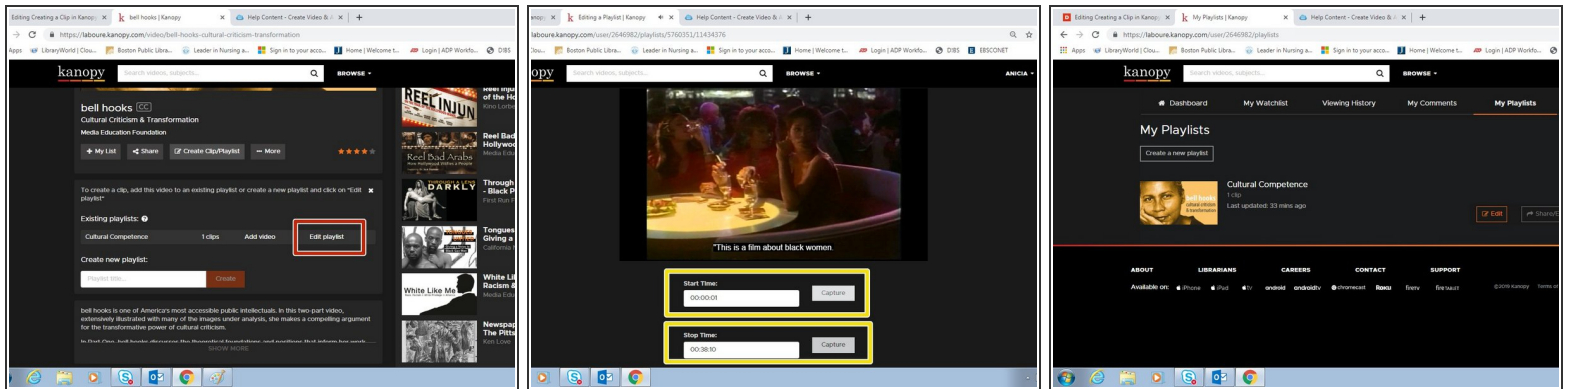

- Access Kanopy: <http://laboure.kanopy.com>
- Enter username: **laboure** password: *find password on my.laboure.edu Library Services page
- Create an account by selecting "Sign Up". You will be asked to verify the email you provided.

Step 2 — Selecting a film to clip

- After browsing available films, select a title.
- Click "Create clip/Playlist"
- To create a clip, add this video to a playlist. You may need to first create a new playlist or add it to an existing playlist.

Step 3 — Editing a film (clipping)

- Click "Edit playlist"
- Give your clip a title and a description (optional)
- To choose your segments, you can Play the film and click the first “Capture button” when you want the recording to start and then click the second “Capture button” when you want the clip to end. This will give you the start and end time of the clip. Then click “Save Clip”.
- If you already know the start and end time of the clip, just type the numbers into the time fields and click “Save Clip”
- The clip will be available in your playlists
